Business Requirements Document (BRD)

Workers' Compensation Claims Analytics

Project: Workers' Compensation Claims Analysis & Reporting
Document Type: Business Requirements Document
Role: Business Analyst

1. Business Background

The organisation requires better visibility into its workers' compensation claims to understand claim volumes, financial exposure, injury trends, return-to-work delays, and claims processing efficiency.

Currently, limited visibility into claims performance makes it difficult for management to identify costly injury types, monitor outstanding settlement liabilities, understand operational bottlenecks, and determine where improvements in workplace safety and claims management are required.

2. Business Objective

The objective is to provide management with a centralised, interactive reporting solution that enables data-driven decisions around workers' compensation claims, financial liabilities, workplace safety, and claims management performance.

3. Business Requirements

BR-01: Claims Overview

The business requires visibility into the total number of unique members and claims to understand the overall size of the workers' compensation portfolio.

BR-02: Claims Status Monitoring

The business requires visibility into the distribution and percentage of Open, Pending, and Closed claims to monitor claims progress and identify outstanding cases.

BR-03: Claims Financial Exposure

The business requires insights into average and median incurred costs across different claim statuses to understand financial exposure and claim severity.

BR-04: Outstanding Settlement Liabilities

The business requires visibility into the total outstanding settlement amount for Open and Pending claims to understand current financial liabilities.

BR-05: Injury Cause Analysis

The business requires identification of the injury causes contributing to the highest number of claims and greatest total incurred costs.

BR-06: Injury Cost Analysis

The business requires visibility into the typical financial cost per claim across different injury causes to identify injuries with the greatest financial impact.

BR-07: Industry Sector Injury Analysis

The business requires identification of the most financially significant injury causes across different member sectors to understand sector-specific workplace injury patterns.

BR-08: Return-to-Work Performance

The business requires visibility into the average time taken for employees to return to work across different injury types to identify injuries associated with longer recovery periods.

BR-09: Claims Review Performance

The business requires visibility into average claims review delays across different claims management teams to identify operational inefficiencies.

BR-10: System Issues and Claims Processing

The business requires an understanding of the relationship between system issues and claims review delays to identify whether technical problems are affecting operational performance.

BR-11: Claims Rework Analysis

The business requires visibility into the relationship between system issues and claims rework frequency to understand factors contributing to additional processing effort.

BR-12: Claims Closure Performance

The business requires insights into the average time taken to close claims from the date of injury, segmented by injury cause, to identify causes associated with longer claim resolution periods.

BR-13: Claims Lodgement Performance

The business requires visibility into the average time between injury occurrence and claim lodgement for Open and Pending claims to identify potential delays in the reporting process.

4. Reporting Requirements

The business requires an interactive dashboard that provides:

- High-level claims and member performance indicators.
- Claims status distribution.
- Financial exposure and outstanding settlement amounts.
- Injury cause and injury type analysis.
- Sector-level injury comparisons.
- Return-to-work performance indicators.
- Claims review and closure performance.
- System issues and rework analysis.
- Claims lodgement delay analysis.
- The ability to filter and compare results across relevant business dimensions.

5. Expected Business Outcome

The reporting solution should enable management to:

- Improve visibility into workers' compensation claims.
- Monitor outstanding financial liabilities.
- Identify injury causes contributing to significant financial costs.
- Understand workplace injury patterns across different sectors.
- Identify delays in claims review, lodgement, and closure.
- Monitor factors affecting claims processing efficiency.
- Make informed decisions regarding workplace safety and claims management performance.
